

**CHILD'S PUSHCHAIR WITH FOLDING FRAME,  
INTEGRATING MEANS TO HELP FOLDING**

ABSTRACT OF THE DISCLOSURE

A child's pushchair has a folding frame  
5 comprising two front legs, each carrying at least one  
wheel. The frame is designed in such a way that,  
when it is being folded, the front legs approach each  
other. At least one of the front legs is integral  
with means for bearing on the ground, set in such a  
10 way that they are able to come into contact with the  
ground during folding, and not to touch the ground  
when the child's pushchair is unfolded and standing  
on its wheels. These bearing means can, in  
particular, be castors.
